

DATA FILE: cancer_419.CSV

A team of urologists was interested in the association between prostate-specific antigen (PSA) and a number of prognostic clinical measurements in men with advanced prostate cancer. The file **cancer.csv** contains the following measurements, made on 97 such men.

GROUPING VARIABLE:

Use the grouping variable DIAGN which is indicator of the severity of seminal vesicle invasion (= 1 if low, =2 if moderate, = 3 if severe).

All variables in the data set are:

DIAGN = seminal vesicle invasion severity (= 1 if low, =2 if moderate, = 3 if severe)

PSA = serum PSA level, in mg/ml

Volume = volume of the prostate cancer, in cc

Weight = weight of the prostate, in g

Age = age of the patient, in years

BPH = amount of benign prostatic hyperplasia, in cm^2

Capsule = degree of capsular penetration

Gleason = pathologically determined qualitative “grade” of the disease, with higher scores indicating worse prognosis
